Rating games website

Our website is an interactive platform where users can engage with a vibrant community of gamers.

Users can easily sign up for an account, allowing them to log in, create a personalized profile, and start rating their favorite video games.

Within the platform, users can share their opinions on various games, discover new titles through community recommendations, and explore a curated list of top-rated games.

CSS/styling

This CSS code creates a fullscreen animated GIF background and centers the content in the middle of the page. The centered content is styled with a dark, semi-transparent box that has rounded corners and a shadow for a modern look. Buttons are styled to be simple and interactive, changing color when hovered. The design is clean and visually appealing.

This css is the same in all the pages except the color it's diffrent.

```
<style>
/* Fullscreen background GIF */
body {
  margin: 0;
  padding: 0;
  display: flex;
  justify-content: center;
  align-items: center;
  height: 100vh;
  background-image: url('./images/night.gif');
  background-size: cover;
  font-family: Arial, sans-serif;
  color: white; }

/* Center container for content */
.center-container {
  background-color: rgba(0, 0, 0, 0.8);
  padding: 40px;
  text-align: center;
  border-radius: 8px;
  box-shadow: 0 4px 8px rgba(0, 0, 0, 0.3); }
```

```
/* Button styling */
.button {
  display: inline-block;
  margin: 10px 20px;
  padding: 10px 20px;
  font-size: 1em;
  font-weight: bold;
  color: #333;
  background-color: #fff;
  border: none;
  border-radius: 5px;
  cursor: pointer;
  transition: background-color 0.3s; }

.button:hover {
  background-color: #ddd; }
</style>
```

Database

The screenshot shows a MySQL Workbench interface. At the top, there's a navigation bar with tabs: 'Show panel' (selected), 'Structure', 'SQL', 'Search', 'Insert', 'Export', and 'Import'. Below the navigation bar, a message says: 'Current selection does not contain a unique column. Grid edit, checkbox, Edit, Copy and Delete features are disabled.' A green status bar at the top indicates: 'Showing rows 0 - 3 (4 total, Query took 0.0012 seconds.)'. The SQL query shown is: 'SELECT * FROM `users`'. Below the query, there are links for Profiling, Edit inline, Edit, Explain SQL, Create PHP code, and Refresh. There are also buttons for Show all (unchecked), Number of rows: 25 (selected), Filter rows, and a search bar for 'Search this table'. The main area displays a table with the following data:

username	email	password
yaff	wasayif@gmail.com	3
yaff4	wasayifmm@gmail.com	9
wasayif	wasayif2004@gmail.com	0
jeji_xxx	jeji@gmail.com	4297

Below the table are the same controls: Show all (unchecked), Number of rows: 25 (selected), Filter rows, and a search bar for 'Search this table'.

“Our SQL database is designed to securely store user information, including username, email, and password. Each entry in the database represents a registered user, ensuring that their credentials are safely stored for authentication purposes. This setup allows users to create accounts, log in securely, and access personalized features on our video game rating platform.”

server.php

This PHP script handles user registration and login functionality for the website. It starts by initializing variables and connecting to the database (project) using MySQLi.

Registration: When a user submits the registration form:

Input fields (username, email, and passwords) are validated to ensure all required fields are filled, and the passwords match. A query checks the database to ensure the username and email are unique.

If no errors are found, the password is encrypted using md5 and saved into the users table along with the username and email. The user is then logged in, and a session is created.

The screenshot shows a registration form titled "Register". It includes fields for Username (layan), Email (layan@gmail.com), Password, and Confirm password. Above the form, error messages are displayed: "Username already exists" and "email already exists". At the bottom, there is a "Register" button and a link "Already a member? [Sign in](#)".

examples if there was an error

Login: When a user submits the login form:

The input fields (username and password) are validated. The password is encrypted with md5 and checked against the database. If a match is found, the user is logged in, and a session is created. Otherwise, an error message is added. The script uses session variables to manage user authentication and redirects logged-in users to the main page (index.php).

The screenshot shows a login form titled "Login". It includes fields for Username (wasayif) and Password. An error message "Wrong username/password combination" is displayed above the form. At the bottom, there is a "Login" button and a link "Not yet a member? [Sign up](#)".

server.php(wasyif)

This PHP script handles user registration and login for a website. It starts a session, initializes variables, and connects to a database. For registration, it collects input from a form, validates the data (e.g., checking if fields are filled and passwords match), ensures no duplicate usernames or emails exist, and securely stores the new user in the database. For login, it verifies the user's credentials against the database. If successful, it starts a session for the user and redirects them to the homepage. Errors during the process are stored in an array for feedback.

```
<?php
session_start();

// initializing variables
$username = "";
$email = "";
$errors = array();

// connect to the database
$db = mysqli_connect('localhost', 'root', "", 'project');

// REGISTER USER
if (isset($_POST['reg_user'])) {
    // receive all input values from the form
    $username = mysqli_real_escape_string($db,
    $_POST['username']);
    $email = mysqli_real_escape_string($db, $_POST['email']);
    $password_1 = mysqli_real_escape_string($db,
    $_POST['password_1']);
    $password_2 = mysqli_real_escape_string($db,
    $_POST['password_2']);

    // form validation: ensure that the form is correctly filled ...
    // by adding (array_push()) corresponding error unto
    // $errors array
    if (empty($username)) { array_push($errors, "Username is
required"); }
    if (empty($email)) { array_push($errors, "Email is
required"); }
    if (empty($password_1)) { array_push($errors, "Password is
required"); }
    if ($password_1 != $password_2) {
        array_push($errors, "The two passwords do not match"); }
    // first check the database to make sure
    // a user does not already exist with the same username
    // and/or email
    $user_check_query = "SELECT * FROM users WHERE
    username='$username' OR email='$email' LIMIT 1";
    $result = mysqli_query($db, $user_check_query);
    $user = mysqli_fetch_assoc($result);

    if ($user) { // if user exists
        if ($user['username'] === $username) {
            array_push($errors, "Username already exists"); }
        if ($user['email'] === $email) {
            array_push($errors, "email already exists"); } }

    // Finally, register user if there are no errors in the
    // form
    if (count($errors) == 0) {
        $password = md5($password_1); // encrypt the
        password before saving in the database
        $query = "INSERT INTO users (username, email,
        password)
        VALUES('$username', '$email', '$password')";
        mysqli_query($db, $query);
        $_SESSION['username'] = $username;
        $_SESSION['success'] = "You are now logged in";
        header('location: index.php'); } }

// LOGIN USER
if (isset($_POST['login_user'])) {
    $username = mysqli_real_escape_string($db,
    $_POST['username']);
    $password = mysqli_real_escape_string($db,
    $_POST['password']);

    if (empty($username)) {
        array_push($errors, "Username is required");
    }
    if (empty($password)) {
        array_push($errors, "Password is required");
    }

    if (count($errors) == 0) {
        $password = md5($password);
        $query = "SELECT * FROM users WHERE
        username='$username' AND password='$password'";
        $results = mysqli_query($db, $query);
        if (mysqli_num_rows($results) == 1) {
            $_SESSION['username'] = $username;
            $_SESSION['success'] = "You are now logged in";
            header('location: index.php');
        } else {
            array_push($errors, "Wrong username/password
            combination");
        }
    }
}

?>
```

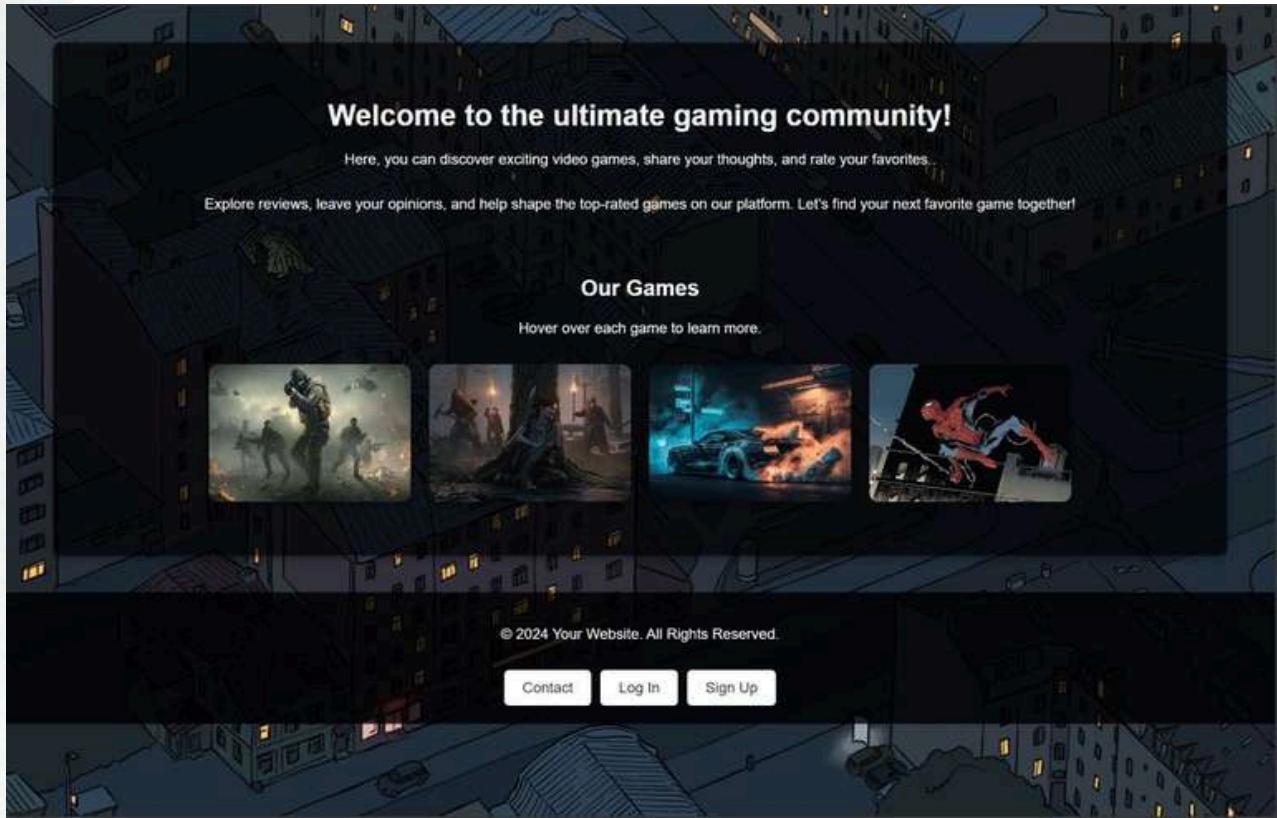

errors.php(jana)

This PHP code snippet displays error messages stored in the \$errors array. If the array contains one or more errors (i.e., count(\$errors) > 0), it creates a `<div>` with the class `error`. Inside the `<div>`, it loops through each error in the array using `foreach` and displays it within a `<p>` tag. This ensures that all error messages are visible to the user, making it easier to identify and fix issues with their input.

```
<?php if (count($errors) > 0) : ?>
<div class="error">
<?php foreach ($errors as $error) : ?>
<p><?php echo $error ?></p>
<?php endforeach ?>
</div>
<?php endif ?>
```

Homepage.php(wasyif)

This code creates a welcome page for a website. It greets visitors with a message and provides two buttons: one to log in and another to sign up. It's a simple starting point for users to choose how they want to proceed.

Homepage.php(wasyif)

```
<?php include('server.php'); ?>

<div class="input-group">
<button type="submit" class="btn" name="login_user">Login</button>
</div>
<p>Not yet a member? <a href="register.php">Sign up</a></p>
</div>
</form>
</body>
</html>
```

register.php(wasyif)

This code creates a registration page where users can sign up by entering their username, email, and password (with confirmation).

It checks for errors, displays messages if needed, and submits the details to the server for processing. There's also a link to log in if the user already has an account.

register.php(wasyif)

```
<?php include('server.php') ?>
<!DOCTYPE html>
<html>
<head>
<style>

/* the same CSS up there*/

/* Form input styling */
input[type="text"], input[type="password"] {
width: 100%;

</div>
<p>Already a member? <a href="login.php">Sign in</a></p>
</div>
</form>
</body>
</html>
```

index.php(dynamic)(jana)

This page creates a home page that checks if a user is logged in. If they're not logged in, they are redirected to the login page. If the user is logged in, their username is displayed, and they can see a "logout" link to end their session. There's also a link to another page ("p4.html") for logged-in users. If any success messages are set (like after logging in), they are displayed at the top.

index.php(dynamic)(jana)

```
<?php
session_start();

if (!isset($_SESSION['username'])) {
$_SESSION['msg'] = "You must log in first";
header('location: login.php'); }
if (isset($_GET['logout'])) {
session_destroy();
unset($_SESSION['username']);
header("location: login.php"); }
?>
<!DOCTYPE html>
<html>

</div>
<?php endif ?>

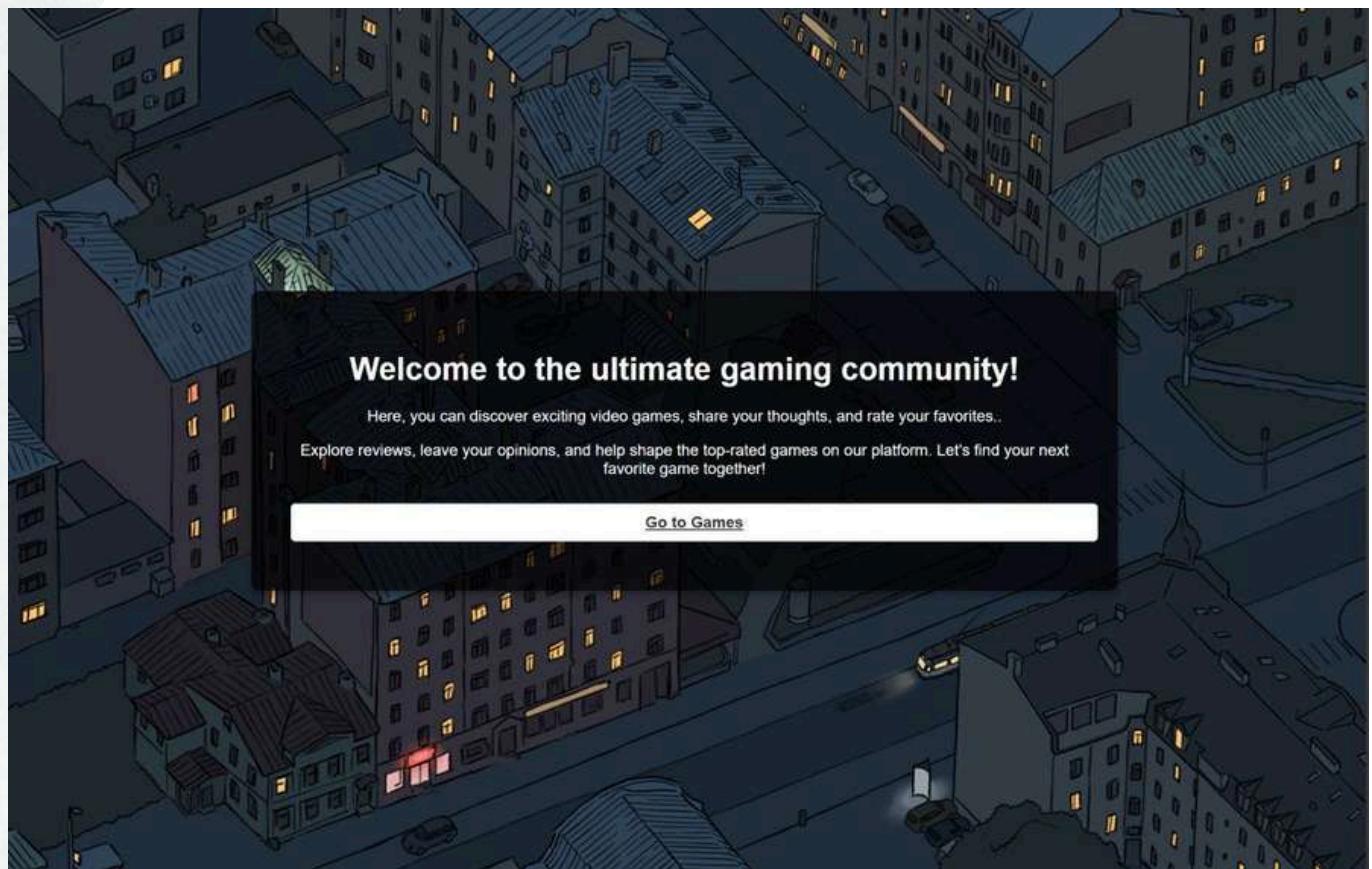

<!-- logged in user information -->
<?php if (isset($_SESSION['username'])) : ?>
<h1> <strong><?php echo $_SESSION['username']; ?></strong>
</h1>
<p> <a href="index.php?logout=1" style="color: red;">logout</a>
</p>

<!-- Link to p4.html -->
<p><a href="p4.html" class="button" style="color: white; background-color: #008CBA; padding: 10px; border-radius: 5px; text-decoration: none;">start</a></p>

<?php endif ?>
</div>
</div>
</body>
</html>
```

welcoming page(wasyif)

This code creates a homepage for a gaming community website. It welcomes users with a headline and a brief introduction about discovering and sharing thoughts on video games. It encourages visitors to explore reviews, rate games, and find their next favorite game. There's also a button to navigate to the games section of the site.

welcoming page

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <a href="games.html" class="button">Go to Games</a>
  </div>

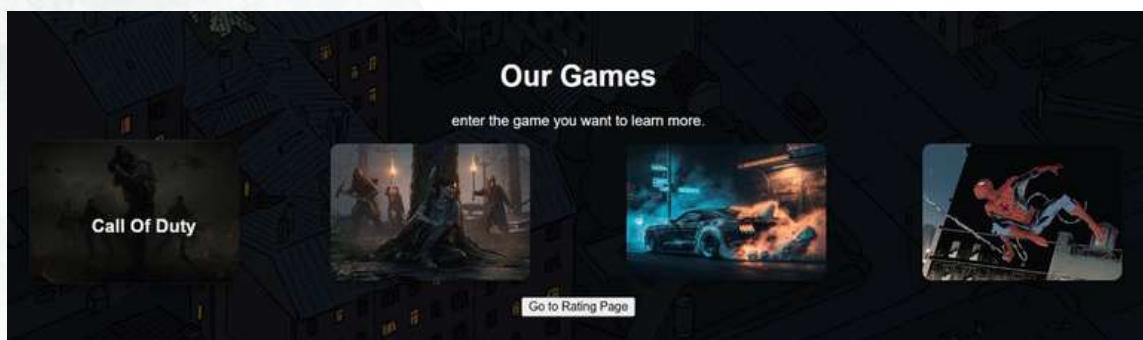

</body>
</html>
```

games.html(jana)

This code creates a game selection page where users can explore different games. Each game is displayed as a card with an image and a title. When users hover over a card, additional details appear in an overlay. Clicking on a card takes them to a page with more information about that game. There's also a button to navigate to a rating page where users can rate the games. The page is visually interactive, with hover effects and smooth transitions to enhance the user experience.

And this is when you hover over the game

game1.html(wasyif)

This code creates a dedicated page for the game Call of Duty, showcasing its image, name, and a brief description. It highlights the game's exciting gameplay, storyline, and challenges. The page includes a button to visit the game's official website and another button to navigate to a rating page where users can leave their feedback. It features a clean and centered design to focus on the game details.

game2.html(jana)

This code creates a page for The Last of Us, displaying the game's image, name, and a short description. It includes buttons to visit the official website and go to a rating page. The design features a dark theme and centers the content to highlight the game.

Games page

A screenshot of the PlayStation Store page for "The Last of Us Part I". The page has a dark background with a large, dramatic image of Ellie looking over her shoulder. At the top, there are links for "Overview", "PC", "Discover The Last of Us", and a red "Buy now" button. The game's title "The Last of Us™ Part I" is prominently displayed. Below the title, it says "Sony Interactive Entertainment" and shows availability on PS4 and PC. It has a rating of 4.90 stars from 45.6K reviews. Two purchase options are shown: one for \$69.99 and another for \$69.99 included with a PlayStation Plus Extra subscription. There is also a link to the Game Catalog. A large "Add to Cart" button is visible. At the bottom, it shows the release date "Released 09/02/2022" and various game features like Offline play enabled, 1 player, Remote Play supported, PSS Version, PSS Pro Enhanced, Game Help supported, and PSS game streaming supported (only with Premium subscription).

game3.html(wasyif)

This code creates a page for GTA Vice City, displaying the game's image, name, and a brief description. The page has a bluish background with a centered design to focus on the game. It uses simple styling to highlight the game's details in a clean layout.

Games page

Game official
website

A screenshot of the official website for "Grand Theft Auto: Vice City". The top navigation bar includes a logo with an 'R' rating, the game title "grand theft auto vice city", a "BUY NOW" button, a search icon, and a user profile icon. The main content area features the game's title "Grand Theft Auto: Vice City" and a "Buy Now" button. To the right, there is a "Game Description" section with text about the game's setting in the 1980s and its non-linear gameplay. Below the description is a colorful collage of various game art and screenshots. The overall layout is clean and modern, despite the game's 1980s setting.

rating.html(wasyif)

this page allows users to rate a video game, provide their feedback, and save the data locally (in their browser), before redirecting them to another page for further viewing or interaction, making it easy for users to share their opinions about games and learn from others through the linked top.html page. The use of local storage allows for the persistence of ratings, making the application more dynamic and interactive.

top.html(jana)

This page highlights the top-rated game based on user ratings stored in the browser's local storage. It retrieves the game with the highest rating and displays its details, including the name, rating, whether it was liked, the user's opinion, and the source of information. If no ratings are available, it shows a "No ratings available" message. The page features a visually appealing night-themed background with a central container for content and a "Go Back to Rate Another Game" button, allowing users to return to the game selection or rating page.
